## Glacial Cycles

During the last 5 million years the Earth has seen fairly regular cycles of advancing and retreating glaciers.

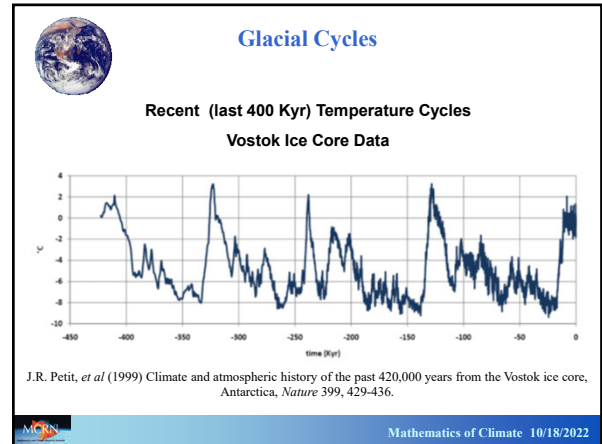

*What causes these cycles?*

Math 5490 9/24/2014

### Glacial Cycles

**What Causes Glacial Cycles?**

**Widely Accepted Hypothesis**

The glacial cycles are driven by the variations in the Earth's orbit (Milankovitch Cycles), causing a variation in incoming solar radiation (insolation).

This hypothesis is widely accepted, but also widely regarded as insufficient to explain the observations.

The additional hypothesis is that there are feedback mechanisms and/or triggering mechanisms that amplify the Milankovitch cycles. What these feedbacks are and how they work are not fully understood.

Mathematics of Climate 10/18/2022

### Glacial Cycles

**Earth's Orbit**

**Kepler's First Law: The orbit of every planet is an ellipse with the Sun at one of the two foci.**

**Johannes Kepler (1571-1630)**

**Eccentricity =  $c/a$**

Mathematics of Climate 10/18/2022

### Glacial Cycles

Perihelion: 91.5  
Aphelion: 94.5

Change in radius:  
3/93 = 3.2%

Change in insolation:  
6.4%

Six percent less insolation in the southern winter than the northern winter.

6.4% of 342 W/m<sup>2</sup> = 22 W/m<sup>2</sup>

Mathematics of Climate 10/18/2022

### Glacial Cycles

#### Global Annual Average Insolation

Solar output:  $K \approx 4 \times 10^{26}$  Watts

Solar intensity at distance  $r$  from the sun:  
 $Q(t) = \frac{K}{4\pi r(t)^2} \text{ Wm}^{-2}$

Cross section of Earth:  $\pi r_E^2 \text{ m}^2$

Global solar input:  $\frac{K r_E^2}{4r(t)^2} \text{ W}$

Total annual solar input ( $P$  = one year (in seconds)):  
 $\int_0^P \frac{K r_E^2}{4r(t)^2} dt = \frac{K r_E^2}{4} \int_0^P \frac{dt}{r(t)^2} \text{ Joules}$

Mathematics of Climate 10/18/2022

### Glacial Cycles

#### Global Annual Average Insolation

Specific angular momentum (angular momentum per unit mass):  
 $\Omega = r^2 \dot{\theta} \text{ m}^2 \text{ s}^{-1}$

Total annual solar input:  
 $\frac{K r_E^2}{4} \int_0^P \frac{dt}{r(t)^2} = \frac{K r_E^2}{4} \int_0^P \frac{\dot{\theta} dt}{\Omega} = \frac{K r_E^2}{4\Omega} \int_0^P \dot{\theta} dt = \frac{\pi K r_E^2}{2\Omega} \text{ Joules}$

Mean annual solar input:  $\frac{\pi K r_E^2}{2P\Omega} \text{ Watts}$

Mean annual solar intensity on the Earth's surface:  
 $\frac{\pi K r_E^2}{2P\Omega} \cdot \frac{1}{4\pi r_E^2} = \frac{K}{8P\Omega} \text{ Wm}^{-2}$

Mathematics of Climate 10/18/2022

### Glacial Cycles

#### Global Annual Average Insolation

Kepler's Third Law:  
 $P \sim a^{-3/2} \quad a = \text{semimajor axis}$

Derived from Kepler:  
 $1 - e^2 \sim a\Omega^2 \quad e = \text{eccentricity}$

Mean annual solar intensity:  
 $\frac{K}{8P\Omega} = \frac{\hat{K} a^{3/2} a^{3/2}}{\sqrt{1-e^2}} = \frac{\hat{K} a^2}{\sqrt{1-e^2}} \text{ Wm}^{-2}$

Mathematics of Climate 10/18/2022

### Glacial Cycles

#### Planetary Motion

$$m_i \frac{d^2 x_i}{dt^2} = \sum_{j=1}^n \frac{G m_i m_j (x_j - x_i)}{|x_j - x_i|^3}$$

Isaac Newton 1642-1727

Jacques Laskar (1955-)

The orbits of all the planets can be computed (both forward and backward in time) for billions of years.

Mathematics of Climate 10/18/2022

### Glacial Cycles

#### Global Annual Average Insolation

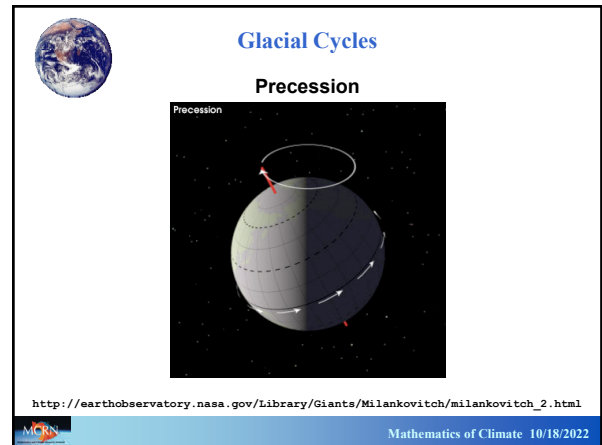

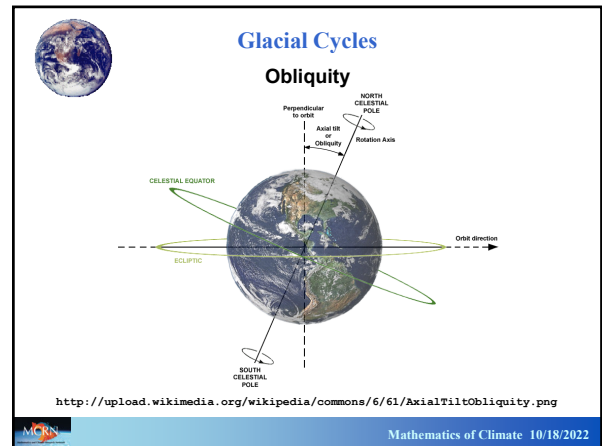

Laskar:  
 $\frac{\hat{K} a^2}{\sqrt{1-e^2}}$

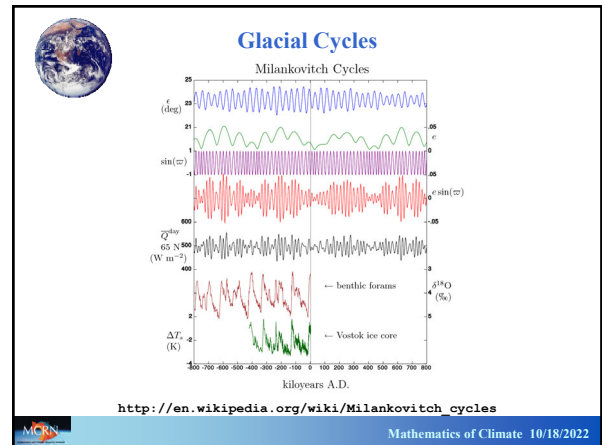

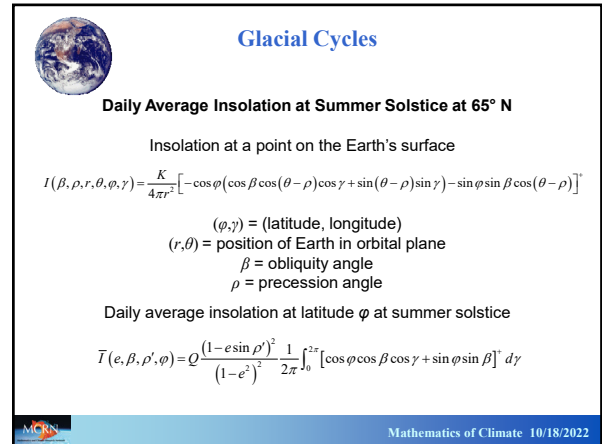

Fig. 11. Variation of the semi-major axis of the Earth-Moon barycenter (in AU) from -250 to +250 Myr.

Semi major axis does not change much:  
0.005% corresponding to .01% change in global average insolation

J. Laskar, et al (2004) A long-term numerical solution for the insolation quantities of the Earth, *Astronomy & Astrophysics* 428, 261-285.

**Glacial Cycles**

**Who was Milankovitch?**

Milutin Milankovitch was a Serbian mathematician and professor at the University of Belgrade.

In 1920 he published his seminal work on the relation between insolation and the Earth's orbital parameters.

In 1941 he published a book explaining his entire theory.

His work was not fully accepted until 1976.

**What happened in 1976?**

Hays, Imbrie, and Shackleton, "Variations in the Earth's Orbit: Pacemaker of the Ice Ages," *Science* **194**, 10 December 1976.

John Imbrie

"It is concluded that changes in the earth's orbital geometry are the fundamental cause of the succession of Quaternary ice ages."

Mathematics of Climate 10/18/2022

**Glacial Cycles**  
Hays, et al, Summary

- 1) Three indices of global climate have been monitored in the record of the past 450,000 years in Southern Hemisphere ocean-floor sediments.
- 2) ... climatic variance of these records is concentrated in three discrete spectral peaks at periods of 23,000, 42,000, and approximately 100,000 years. These peaks correspond to the dominant periods of the earth's solar orbit, and contain respectively about 10, 25, and 50 percent of the climatic variance.

Hays, et al, *Science* 194 (1976), p. 1125

**Glacial Cycles**  
Hays, et al, Summary

- 3) The 42,000-year climatic component has the same period as variations in the obliquity of the earth's axis and retains a constant phase relationship with it.
- 4) The 23,000-year portion of the variance displays the same periods (about 23,000 and 19,000 years) as the quasiperiodic precession index.
- 5) The dominant, 100,000-year climatic component has an average period close to, and is in phase with, orbital eccentricity. Unlike the correlations between climate and the higher-frequency orbital variations (which can be explained on the assumption that the climate system responds linearly to orbital forcing), **an explanation of the correlation between climate and eccentricity probably requires an assumption of nonlinearity.**

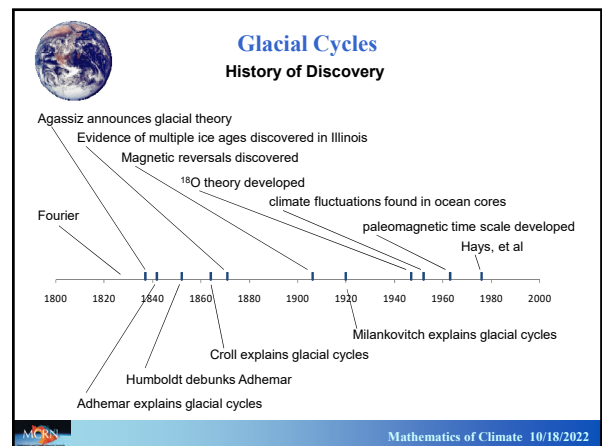

Hays, et al, *Science* 194 (1976), p. 1125

**Glacial Cycles**  
Hays, et al, Summary

- 6) It is concluded that changes in the earth's orbital geometry are the fundamental cause of the succession of Quaternary ice ages.
- 7) A model of future climate based on the observed orbital-climate relationships, **but ignoring anthropogenic effects**, predicts that the long-term trend over the next seven thousand years is toward **extensive Northern Hemisphere glaciation**.
