

Group Theory and Differential Equations

Lecture Notes at the University of Minnesota
1959 - 1960

by

Lawrence Markus

TABLE OF CONTENTS

Group Theory and Differential Equations

I. Lie Theory of Transformation Groups	
1. Historical background.	1.
2. Examples of different types of differential equations and transformation groups	2.
3. Examples of abstract groups.	5.
4. One parameter transformation groups on R^2	8.
5. Invariants of one parameter transformation groups on R^2	15.
6. Canonical forms for certain second order differential equations	21.
7. Topological groups	27.
8. Lie groups	37.
9. Lie algebras	44.
10. Infinitesimal transformation groups	53.
11. Differential invariants of transformation groups.	63.
12. The complete transformation group of a second order differential system	68.
13. Solvable infinitesimal transformation groups and the solution of differential equations by quadrature.	74.
Problems.	77.
Bibliography.	79.
II. The Monodromy Group and Fuchsian Differential Equations.	
1. Introduction. An example of the monodromy group.	80.
2. Survey of properties of analytic functions of several variables	82.
3. Existence, uniqueness, continuation, and singularities of solutions	89.
4. Complex manifolds.	93.
5. First order nonlinear differential equations	98.
6. Linear differential equations and the monodromy group.	100.

7.	Fuchsian differential equations on Riemann surfaces.	106.
8.	Local theory of Fuchsian differential equations.	114.
9.	Fuchsian differential equations on the Riemann sphere.	120.
10.	Remarks on the second order Fuchsian equation on S^2	124.
11.	The hypergeometric differential equation on the Riemann sphere.	125.
12.	Hypergeometric equations with a finite monodromy group.	134.
13.	Existence and uniqueness theorems for Fuchsian differential equations with a prescribed monodromy group.	136.
	Problems.	144.
	Bibliography.	146.

III. The Galois or Rationality Group of a Linear Homogeneous Differential Equation

1.	Integration of differential equations in finite terms containing elementary functions.	148.
2.	Differential field extensions and Liouville elementary functions	150.
3.	Transcendental and Hypertranscendental field extensions. Hölder's theorem on the Gamma function.	160.
4.	Functions of finite order and Liouville's principle.	170.
5.	Liouville's theory of the Bessel and Riccati differential equations.	173.
6.	Liouville, generalized Liouville, and Picard-Vessiot extensions of differential fields, and solvability of differential equations.	187.
7.	Galois group and Galois correspondence.	189.
8.	Examples of the Galois group of a Picard-Vessiot extension.	192.
9.	Ideals and algebraic varieties. Zariski topology.	195.
10.	Algebraic matrix groups.	200.
11.	Solvable algebraic matrix groups.	203.
12.	The Galois group of a Picard-Vessiot extension is an algebraic matrix group.	208.
13.	A Picard-Vessiot extension is normal.	214.

14. Completion of the Galois correspondence. 218.

15. Solution of differential equations in elementary functions. 221.

 Problems. 225.

 Bibliography. 227.
