Dispersion

**Definition.** A linear partial differential equation is called *dispersive* if the different Fourier modes travel unaltered but at different speeds.

Substituting

\[ u(t, x) = e^{i(kx - \omega t)} \]

produces the dispersion relation

\[ \omega = \omega(k) \]

relating frequency $\omega$ and wave number $k$.

Phase velocity:

\[ c_p = \frac{\omega(k)}{k} \]

Group velocity:

\[ c_g = \frac{d\omega}{dk} \]  

*(stationary phase)*
The simplest linear dispersive wave equation:

\[
\frac{\partial u}{\partial t} = \frac{\partial^3 u}{\partial x^3}
\]

Dispersion relation: \( \omega = k^3 \)

Phase velocity: \( c_p = \frac{\omega}{k} = k^2 \)

Group velocity: \( c_g = \frac{d\omega}{dk} = 3k^2 \)

Thus, wave packets (and energy) move faster (to the right) than the individual waves.
Linear Dispersion on the Line

\[ \frac{\partial u}{\partial t} = \frac{\partial^3 u}{\partial x^3} \quad u(0, x) = f(x) \]
Linear Dispersion on the Line

\[ \frac{\partial u}{\partial t} = \frac{\partial^3 u}{\partial x^3} \quad u(0, x) = f(x) \]

Fourier transform solution:

\[ u(t, x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \hat{f}(k) e^{i(kx + k^3 t)} \, dk \]
Linear Dispersion on the Line

\[ \frac{\partial u}{\partial t} = \frac{\partial^3 u}{\partial x^3} \quad u(0, x) = f(x) \]

Fourier transform solution:

\[ u(t, x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \hat{f}(k) e^{i(kx + k^3t)} \, dk \]

Fundamental solution \( u(0, x) = \delta(x) \)

\[ u(t, x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{i(kx + k^3t)} \, dk = \frac{1}{\sqrt[3]{3t}} \text{Ai} \left( \frac{x}{\sqrt[3]{3t}} \right) \]
$t = 0.03$  

$t = 0.1$  

$t = \frac{1}{3}$  

$t = 1$  

$t = 5$  

$t = 20$
Linear Dispersion on the Line

\[ \frac{\partial u}{\partial t} = \frac{\partial^3 u}{\partial x^3} \quad u(0, x) = f(x) \]

\[ u(t, x) = \frac{1}{\sqrt[3]{3t}} \int_{-\infty}^{\infty} f(\xi) \text{Ai} \left( \frac{x-\xi}{\sqrt[3]{3t}} \right) d\xi \]
Linear Dispersion on the Line

\[
\frac{\partial u}{\partial t} = \frac{\partial^3 u}{\partial x^3} \quad u(0, x) = f(x)
\]

\[
u(t, x) = \frac{1}{\sqrt[3]{3t}} \int_{-\infty}^{\infty} f(\xi) \text{Ai} \left( \frac{x - \xi}{\sqrt[3]{3t}} \right) d\xi
\]

Step function initial data: \[ u(0, x) = \sigma(x) = \begin{cases} 0, & x < 0, \\ 1, & x > 0. \end{cases} \]
Linear Dispersion on the Line

\[ \frac{\partial u}{\partial t} = \frac{\partial^3 u}{\partial x^3} \quad u(0, x) = f(x) \]

\[ u(t, x) = \frac{1}{\sqrt[3]{3t}} \int_{-\infty}^{\infty} f(\xi) \text{Ai} \left( \frac{x - \xi}{\sqrt[3]{3t}} \right) d\xi \]

Step function initial data: \( u(0, x) = \sigma(x) = \begin{cases} 0, & x < 0, \\ 1, & x > 0. \end{cases} \)

\[ u(t, x) = \frac{1}{3} - H \left( - \frac{x}{\sqrt[3]{3t}} \right) \]

\[ H(z) = \frac{z \Gamma \left( \frac{2}{3} \right) {}_1 F_2 \left( \frac{1}{3}; \frac{2}{3}, \frac{4}{3}; \frac{1}{9} z^3 \right)}{3^{5/3} \Gamma \left( \frac{2}{3} \right) \Gamma \left( \frac{4}{3} \right)} - \frac{z^2 \Gamma \left( \frac{2}{3} \right) {}_1 F_2 \left( \frac{2}{3}; \frac{4}{3}, \frac{5}{3}; \frac{1}{9} z^3 \right)}{3^{7/3} \Gamma \left( \frac{4}{3} \right) \Gamma \left( \frac{5}{3} \right)} \]
$t = 0.005$  

$\quad t = 0.01$  

$\quad t = 0.05$  

$\quad t = 0.1$  

$\quad t = 0.5$  

$\quad t = 1$. 
Periodic Linear Dispersion

\[ \frac{\partial u}{\partial t} = \frac{\partial^3 u}{\partial x^3} \]

\[ u(t, 0) = u(t, 2\pi) \quad \frac{\partial u}{\partial x}(t, 0) = \frac{\partial u}{\partial x}(t, 2\pi) \quad \frac{\partial^2 u}{\partial x^2}(t, 0) = \frac{\partial^2 u}{\partial x^2}(t, 2\pi) \]
Periodic Linear Dispersion

\[ \frac{\partial u}{\partial t} = \frac{\partial^3 u}{\partial x^3} \]

\[ u(t, 0) = u(t, 2\pi) \quad \frac{\partial u}{\partial x} (t, 0) = \frac{\partial u}{\partial x} (t, 2\pi) \quad \frac{\partial^2 u}{\partial x^2} (t, 0) = \frac{\partial^2 u}{\partial x^2} (t, 2\pi) \]

Step function initial data:

\[ u(0, x) = \sigma(x) = \begin{cases} 0, & x < 0, \\ 1, & x > 0. \end{cases} \]
Periodic Linear Dispersion

\[ \frac{\partial u}{\partial t} = \frac{\partial^3 u}{\partial x^3} \]

\[ u(t, 0) = u(t, 2\pi) \quad \frac{\partial u}{\partial x}(t, 0) = \frac{\partial u}{\partial x}(t, 2\pi) \quad \frac{\partial^2 u}{\partial x^2}(t, 0) = \frac{\partial^2 u}{\partial x^2}(t, 2\pi) \]

Step function initial data:

\[ u(0, x) = \sigma(x) = \left\{ \begin{array}{ll} 0, & x < 0, \\ 1, & x > 0. \end{array} \right. \]

\[ u^*(t, x) \sim \frac{1}{2} + \frac{2}{\pi} \sum_{j=0}^{\infty} \frac{\sin\left( (2j + 1)x - (2j + 1)^3 t \right)}{2j + 1}. \]
$t = 0.$
$t = 0.1$
$t = 0.2$
$t = 0.3$
$t = 0.4$
$t = 0.5$
\[ t = \frac{1}{30} \pi \]
\[ t = \frac{1}{15} \pi \]
\[ t = \frac{1}{10} \pi \]
\[ t = \frac{2}{15} \pi \]
\[ t = \frac{1}{6} \pi \]
\[ t = \frac{1}{5} \pi \]
$t = \pi$

$t = \frac{1}{2} \pi$

$t = \frac{1}{3} \pi$

$t = \frac{1}{4} \pi$

$t = \frac{1}{5} \pi$

$t = \frac{1}{6} \pi$

$t = \frac{1}{7} \pi$

$t = \frac{1}{8} \pi$

$t = \frac{1}{9} \pi$
Theorem. At rational time \( t = \frac{\pi p}{q} \), the solution \( u^*(t, x) \) is constant on every subinterval \( \frac{\pi j}{q} < x < \frac{\pi (j + 1)}{q} \). At irrational time \( u^*(t, x) \) is a non-differentiable continuous function.
**Lemma.**

\[ f(x) \sim \sum_{k=-\infty}^{\infty} c_k e^{i k x} \]

is piecewise constant on intervals \( p \pi/q < x < (p + 1) \pi/q \) if and only if

\( \hat{c}_k = \hat{c}_l, \quad k \equiv l \not\equiv 0 \mod 2q, \quad \hat{c}_k = 0, \quad 0 \not\equiv k \equiv 0 \mod 2q. \)

where

\[ \hat{c}_k = \frac{\pi k c_k}{i q (e^{-i \pi k/q} - 1)} \quad \text{for} \quad k \not\equiv 0 \mod 2q. \]

\[ \Rightarrow \quad \text{DFT} \]
The Fourier coefficients of the solution \( u^*(t, x) \) at rational time \( t = \pi p/q \) are

\[
c_k = b_k \left( \pi \frac{p}{q} \right) = b_k(0) e^{i(k x - k^3 \pi p/q)},
\]

where

\[
  b_k(0) = \begin{cases} 
  -i/\pi k, & \text{if } k \text{ odd}, \\
  1/2, & \text{if } k = 0, \\
  0, & \text{if } 0 \neq k \text{ even}. 
  \end{cases}
\]

Crucial observation:

if \( k \equiv l \pmod{2q} \), then \( k^3 \equiv l^3 \pmod{2q} \)

and so

\[
e^{i(k x - k^3 \pi p/q)} = e^{i(l x - l^3 \pi p/q)}
\]
Theorem. At rational time $t = \pi p/q$, the fundamental solution to the initial-boundary value problem is a linear combination of finitely many delta functions.
**Theorem.** At rational time \( t = \frac{\pi p}{q} \), the fundamental solution to the initial-boundary value problem is a linear combination of finitely many delta functions.

**Corollary.** At rational time, any solution profile \( u(\frac{\pi p}{q}, x) \) to the periodic initial-boundary value problem depends on only finitely many values of the initial data, namely

\[
u(0, x_j) = f(x_j) \quad \text{where}
\]

\[
x_j = \frac{\pi j}{q} \quad \text{for} \quad j = 0, \ldots, 2q - 1 \quad \text{when} \quad p \text{ is odd, or}
\]

\[
x_j = 2\frac{\pi j}{q} \quad \text{for} \quad j = 0, \ldots, q - 1 \quad \text{when} \quad p \text{ is even.}
\]
The same phenomenon appears in any linearly dispersive equation with “integral” dispersion relation:

$$\omega(k) = \sum_{m=0}^{n} c_m k^m$$

where

$$c_m/c_n \in \mathbb{Q}$$
Linear Schrödinger Equation

$$i \frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$$

Dispersion relation: \( \omega = k^2 \)

Phase velocity: \( c_p = \frac{\omega}{k} = -k \)

Group velocity: \( c_g = \frac{d\omega}{dk} = -2k \)
Periodic Linear Schrödinger Equation

\[ i \frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} \]

\[ u(t, 0) = u(t, 2\pi) \quad \frac{\partial u}{\partial x}(t, 0) = \frac{\partial u}{\partial x}(t, 2\pi) \quad \frac{\partial^2 u}{\partial x^2}(t, 0) = \frac{\partial^2 u}{\partial x^2}(t, 2\pi) \]

Periodic Schrödinger Equation

\[ i \frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} \]

\[ u(t, 0) = u(t, 2\pi) \quad \frac{\partial u}{\partial x} (t, 0) = \frac{\partial u}{\partial x} (t, 2\pi) \quad \frac{\partial^2 u}{\partial x^2} (t, 0) = \frac{\partial^2 u}{\partial x^2} (t, 2\pi) \]

Integrated fundamental solution:

\[ u(t, x) = \frac{1}{2\pi} \sum_{0 \neq k = -\infty}^{\infty} \frac{e^{i(kx + k^2 t)}}{k} \cdot \]

\* For \( x/t \in \mathbb{Q} \), this is known as a Gauss (or, more generally, Weyl) sum, of importance in number theory

\[ \Rightarrow \text{Hardy, Littlewood, Weil, I. Vinogradov, etc.} \]
Integrated fundamental solution:

\[ u(t, x) = \frac{1}{2\pi} \sum_{0 \neq k = -\infty}^{\infty} \frac{e^{i(kx + k^2t)}}{k}. \]

**Theorem.**

- The fundamental solution \( \partial u / \partial x \) is a Jacobi theta function. At rational times \( t = p\pi/q \), it linear combination of delta functions concentrated at rational nodes \( x_j = \pi j/q \).
- At irrational times \( t \), the integrated fundamental solution is a continuous but nowhere differentiable function. (The fractal dimension of its graph is \( \frac{3}{2} \).)

**Periodic Dispersion**

\[
\frac{\partial u}{\partial t} = F(D_x) u, \quad u(t, x + 2\pi) = u(t, x)
\]

Dispersion relation:

\[
u(t, x) = e^{i(kx - \omega t)}, \quad \omega(k) = -i F(-i k)
\]

\[\implies \text{assumed real}\]

Step function initial data:

\[
u(0, x) = \sigma(x) = \begin{cases} 
0, & x < 0, \\
1, & x > 0.
\end{cases}
\]

\[
u^*(t, x) \sim \frac{1}{2} + \frac{2}{\pi} \sum_{j=0}^{\infty} \frac{\sin((2j + 1)x - \omega(k)t)}{2j + 1}.
\]

\[\star \quad \omega(-k) = -\omega(k) \text{ odd}\]

Polynomial dispersion, rational \( t \implies \text{Weyl exponential sums} \]
