

(49)

(b) \Leftrightarrow (c): Check that the rings $\mathbb{Z}[i]/(p)$, $\mathbb{F}_p[x]/(x^2+1)$ are isomorphic, as both are isomorphic to $\mathbb{Z}[x]/(p, x^2+1)$:

one can check $\mathbb{Z}[x] \xrightarrow{\varphi_1} \mathbb{Z}[i]/(p)$
 $x \longmapsto i + (p) =: \bar{i}$

and $\mathbb{Z}[x] \xrightarrow{\varphi_2} \mathbb{F}_p[x]/(x^2+1)$
 $x \longmapsto \bar{x}$

both ~~are~~ are surjective and have $\ker(\varphi_1) = \ker(\varphi_2) = (p, x^2+1) \subset \mathbb{Z}[x]$

[This is an instance of using Noether's 3rd isomorphism theorem: For ideals $I, J \subset R$

$$R/I+J \cong (R/I)/\bar{J}$$
$$\text{and } R/I+J \cong (R/J)/\bar{I}$$

so these two rings must be isomorphic

Above $R = \mathbb{Z}[x]$, $I = (p)$, $J = (x^2+1)$, $I+J = (p, x^2+1)$

2/29/2019

(c) \Leftrightarrow (d): $\mathbb{F}_p[x]/(x^2+1)$ is a field

$$\Leftrightarrow (x^2+1) \text{ is maximal in } \mathbb{F}_p[x]$$

$$\Leftrightarrow x^2+1 \text{ is irreducible in } \mathbb{F}_p[x]$$

$$\Leftrightarrow x^2+1=0 \text{ has no roots } x \in \mathbb{F}_p$$

$$\Leftrightarrow x^2 = -1 \text{ has no solution } x \in \mathbb{F}_p$$

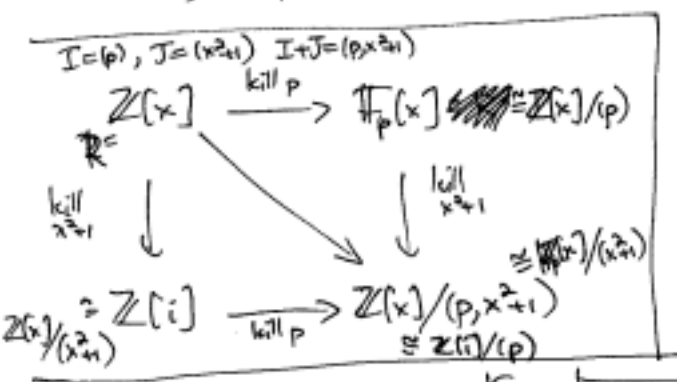

(d) \Leftrightarrow (e): $x^2 = -1$ has a solution in \mathbb{F}_2 , namely $x = \bar{1}$
 $\{0, i\}$

For odd primes p , where $-1 \neq +1$ in \mathbb{F}_p , then $\bar{x}^2 = -1 \Rightarrow \bar{x}^4 = +1$

so \bar{x} is an element of \mathbb{F}_p^\times of order exactly 4. Since \mathbb{F}_p^\times is cyclic, such an \bar{x} exists $\Leftrightarrow 4$ divides $|\mathbb{F}_p^\times| = p-1 \Leftrightarrow p \equiv 1 \pmod{4}$ \blacksquare

(4/1/2)

How were we using Noether's 3rd isomorphism theorem again?

(56)

How many ways to write $n \in \mathbb{Z}$ as $n = a^2 + b^2$ with $a, b \in \mathbb{Z}$?
 i.e. as ordered pairs $(a, b) \in \mathbb{Z}^2$

EXAMPLES:

$$\begin{aligned} \textcircled{1} \quad n = 25 &= 0^2 + (\pm 5)^2 \\ &\stackrel{||}{=} 5^2 = (\pm 5)^2 + 0^2 \\ &= (\pm 3)^2 + (\pm 4)^2 \\ &\stackrel{||}{=} 5^2 = (\pm 4)^2 + (\pm 3)^2 \end{aligned} \quad \left. \vphantom{\begin{aligned} \textcircled{1} \quad n = 25 \\ &= 0^2 + (\pm 5)^2 \\ &\stackrel{||}{=} 5^2 = (\pm 5)^2 + 0^2 \\ &= (\pm 3)^2 + (\pm 4)^2 \\ &\stackrel{||}{=} 5^2 = (\pm 4)^2 + (\pm 3)^2 \end{aligned}} \right\} \begin{aligned} &= 4(2+1) \\ &12 \text{ ways} \end{aligned}$$

$$\begin{aligned} \textcircled{2} \quad n = 125 &= (\pm 5)^2 + (\pm 10)^2 \\ &= (\pm 10)^2 + (\pm 5)^2 \\ &= (\pm 2)^2 + (\pm 11)^2 \\ &\stackrel{||}{=} 2 \cdot 5^2 = (\pm 11)^2 + (\pm 2)^2 \end{aligned} \quad \left. \vphantom{\begin{aligned} \textcircled{2} \quad n = 125 \\ &= (\pm 5)^2 + (\pm 10)^2 \\ &= (\pm 10)^2 + (\pm 5)^2 \\ &= (\pm 2)^2 + (\pm 11)^2 \\ &\stackrel{||}{=} 2 \cdot 5^2 = (\pm 11)^2 + (\pm 2)^2 \end{aligned}} \right\} \begin{aligned} &= 4(3+1) \\ &16 \text{ ways} \end{aligned}$$

$$\begin{aligned} \textcircled{3} \quad n = 50 &= (\pm 1)^2 + (\pm 7)^2 \\ &= (\pm 7)^2 + (\pm 1)^2 \\ &= (\pm 5)^2 + (\pm 5)^2 \end{aligned} \quad \left. \vphantom{\begin{aligned} \textcircled{3} \quad n = 50 \\ &= (\pm 1)^2 + (\pm 7)^2 \\ &= (\pm 7)^2 + (\pm 1)^2 \\ &= (\pm 5)^2 + (\pm 5)^2 \end{aligned}} \right\} \begin{aligned} &= 4(2+1) \\ &12 \text{ ways} \end{aligned}$$

$\textcircled{4} \quad n = 103$ has zero ways

THEOREM: If $n = 2^c p_1^{e_1} \dots p_k^{e_k} q_1^{d_1} \dots q_l^{d_l}$ where p_i, q_j are ^{odd} primes
 $p_i \equiv 1 \pmod{4}$
 $q_j \equiv 3 \pmod{4}$

then #ways to write $n = a^2 + b^2$ with $(a, b) \in \mathbb{Z}^2$
 $= \begin{cases} 0 & \text{if any } d_i \text{ are odd,} \\ 4(e_1+1)\dots(e_k+1) & \text{if all } d_i \text{ are even.} \end{cases}$

proof: If $n = a^2 + b^2 = (a+ib)(a-ib)$ then factor $a+ib = \pi_1 \dots \pi_k \sigma_1 \dots \sigma_l$ in $\mathbb{Z}[i]$

$$\text{and } n = (\pi_1 \dots \pi_k \sigma_1 \dots \sigma_l) (\bar{\pi}_1 \dots \bar{\pi}_k \bar{\sigma}_1 \dots \bar{\sigma}_l)$$

$$= \underbrace{(\pi_1 \bar{\pi}_1)}_{p_1} \dots \underbrace{(\pi_k \bar{\pi}_k)}_{p_k} \underbrace{(\sigma_1 \bar{\sigma}_1)}_{q_1^2} \dots \underbrace{(\sigma_l \bar{\sigma}_l)}_{q_l^2} \Rightarrow \underline{\underline{\text{all } d_i \text{ even}}}$$

primes π_i with $\pi_i \bar{\pi}_i = p_i \equiv 1 \pmod{4}$ or $p_i = 2$
 primes σ_j with σ_j assoc. to $q_j \equiv 3 \pmod{4}$

(51)

On the other hand to obtain

$$2^c \underbrace{p_1^{e_1} \dots p_k^{e_k}}_{\pi_1^{i_1} \bar{\pi}_1^{e_1 - i_1} \dots \pi_k^{i_k} \bar{\pi}_k^{e_k - i_k}} q_1^{d_1} \dots q_\ell^{d_\ell} = n = (a+bi)(a-bi), \text{ if } p_i = \pi_i \bar{\pi}_i \text{ for } i=1, \dots, k$$

then the prime factorization in $\mathbb{Z}(i)$ of $a+bi$ must look, up to units,

$$\text{like } a+bi = (1+i)^c \underbrace{(\pi_1^{i_1} \bar{\pi}_1^{e_1 - i_1})}_{0 \leq i_1 \leq e_1} \dots \underbrace{(\pi_k^{i_k} \bar{\pi}_k^{e_k - i_k})}_{0 \leq i_k \leq e_k} q_1^{d_1/2} \dots q_\ell^{d_\ell/2}$$

e.g. $50 = 2^1 \cdot 5^2$ with $5 = (2+i)(2-i)$

$$= a^2 + b^2 = (a+bi)(a-bi) \text{ where } a+bi = (1+i)^1 (2+i)^2 (2-i)^0 = -1+7i$$

$$= (1+i)^1 (2+i)^1 (2-i)^1 = 5+5i$$

$$= (1+i)^0 (2+i)^0 (2-i)^1 = 7-i$$

There are e_j+1 choices for $i_j \in \{0, 1, 2, \dots, e_j\}$,
 and then 4 choices for a unit to multiply $a+bi$, giving $4 \prod_{j=1}^k (e_j+1)$ total \blacksquare
